

Personal Statement — CCCW Postdoctoral Fellowship (Ref. 535079)

University of Hong Kong

Mengnan Xu

My research occupies a specific intersection: I am a political scientist and public management scholar trained at Beijing Normal University, with eight years of empirical work on Chinese governance — and a year of production-grade AI engineering experience at Apple. These are not separate tracks. The computational methods I built and deployed industrially are the same tools I now bring back to political science, where they address questions that conventional methods cannot reach. It is this combination that I bring to the Postdoctoral Fellowship at the Centre on Contemporary China and the World.

My doctoral dissertation, *The Impact of Targeted Poverty Alleviation Policies on Long-Term Development and Vulnerability to Poverty Relapse Among Rural Households: Evidence from a Quasi-Natural Experiment Using CFPS Panel Data* (Beijing Normal University, defense scheduled May 2026; passed blind external review), conducts a rigorous causal evaluation of China’s flagship anti-poverty program. Drawing on seven waves of CFPS household panel data spanning 2010 to 2022, I apply staggered difference-in-differences designs and a three-stage least squares vulnerability estimation procedure to identify policy effects on household income trajectories and — crucially — on prospective vulnerability to poverty relapse. The central contribution is to show that targeted poverty alleviation operates through multiple channels simultaneously: income gains, labor market restructuring, asset accumulation, and a measurable reduction in households’ exposure to downward risk over a multi-year horizon. This is the first study to apply forward-looking vulnerability measurement to a major CCP governance initiative using a causal identification strategy robust to staggered treatment timing.

Alongside the dissertation, I have developed a parallel conceptual strand, currently under revision for submission to *Journal of Chinese Governance*, that examines the organizational ecology of China’s poverty alleviation governance and proposes the concept of a “development governance knowledge system”: a distinctive model of state-led multi-actor coordination — integrating government agencies, universities, enterprises, and financial institutions — that departs structurally from the NGO-driven, donor-dependent frameworks dominant in international development research. A second working paper, in preparation for *China Quarterly*, extends this framework through text-as-data methods, developing a replicable pipeline for computational analysis of Chinese governance documents at scale.

My first-authored paper, “Poor and Lazy: Understanding Middle-class Perceptions of Poverty in China” (*Journal of Contemporary China*, 2022, SSCI Q1), provides the ideational complement to this governance analysis: it shows how middle-class stigmatization of the poor as morally deficient creates the political conditions that make state-organized, non-market-mediated redistribution institutionally necessary and distinctive. I also contributed to collaborative work on tobacco control policy evaluation using longitudinal administrative data (BMJ Open, 2019; Health, 2019).

The household-level causal analysis and the organizational ecology work share a methodological gap. The dissertation establishes *what* the policy achieves at the household level. The organizational

ecology work maps *who* implements it and through which institutional channels. What neither can yet do — at the scale and resolution required — is connect the two: to trace how variation in actor participation structures, resource allocation logic, and implementation intensity across thousands of counties produces the heterogeneous outcomes the regression analysis reveals. This requires processing hundreds of thousands of policy documents and organizational records. I spent a year at Apple’s Intelligence platform building exactly this infrastructure.

Working on production-scale NLP pipelines, retrieval-augmented generation architectures, and large-scale knowledge integration systems gave me an engineer’s understanding of how LLMs extract structured information from document corpora — and, equally important, where they introduce systematic distortions that require scholarly correction. Moving between research questions and engineering implementation is not a detour; it is how I develop methods that are both technically rigorous and analytically appropriate for governance research. Since April 2026, I have continued this work at AOI, designing full-pipeline data collection and analysis systems for large-scale structured data environments.

The research agenda I bring to CCCW follows directly. My primary proposed project uses LLM-powered document analysis to construct a comprehensive organizational ecology database of China’s poverty alleviation implementation — tracking actor participation, coordination logic, and resource flows across provinces and decades — and uses this database to explain the heterogeneous household-level outcomes my dissertation documents. This project speaks directly to Professor Li Cheng’s program of research on Chinese political leadership and governance capacity: where his work on elite politics and the *Chinese Politics in the Xi Jinping Era* examines the leadership architecture of the party-state, my project examines how that architecture translates into grassroots implementation outcomes — a micro-level complement to CCCW’s macro-level leadership research. My JCC paper on middle-class perceptions of poverty also connects directly to Professor Li’s work on the Chinese middle class and its political consequences.

A second, more exploratory project examines whether and how China’s development governance model — the organizational ecology framework constructed in Project One — travels into ASEAN contexts through South-South cooperation and BRI channels. The scope is deliberately bounded: the goal within the fellowship period is not a fully comparative study but a conceptual mapping of the institutional mechanisms through which Chinese governance knowledge is transmitted internationally, drawing on publicly available policy documents and CCCW’s existing regional research network. This positions the project as groundwork for future comparative research rather than a standalone deliverable, and keeps the primary commitment where the evidence base is strongest: on Project One.

CCCW is the right institutional home for this work. Professor Li Cheng’s leadership program, the Centre’s explicit investment in AI methods for social science, and Hong Kong’s position as an analytical vantage point on mainland governance — embedded enough to access the documentary record, distanced enough to interrogate it — together provide an environment uniquely positioned to support the kind of work I have described above. My connection to HKU is not new: I was selected for the University of Hong Kong Young Scholars Forum in July 2019, an experience that first oriented me toward Hong Kong as an intellectual home for China governance research. I look forward to building on that connection as a member of the CCCW community.
